Jersey Trait Explanations

CRV Herdbuilder Traits

In addition to the traditional U.S. traits we've become accustomed to, CRV brings you more than 20 additional proprietary traits and we call them our HerdBuilder Traits. These include traits such as the CRV Health and CRV Efficiency indexes. Look for the HerdBuilder Traits throughout this directory.

HEALTH

CRV HEALTH - CRV Health indicates the extent to which a bull helps breed a healthier herd. A high score means that a bull's progeny will have reduced rates of mastitis and lameness, will calve easier and breed back sooner. A combination of nearly 60 traits produce this breeding value.

EFFICIENCY

CRV EFFICIENCY - CRV Efficiency indicates the extent to which a bull contributes to a more efficient herd. Improved milk and component production relative to feed intake while accounting for longevity, body condition, and calving interval.

PRODUCTION

Milk - Predicted transmitting ability of pounds of milk in comparison to other cows of the breed born in the same base year.

Fat - Predicted transmitting ability of pounds of fat in comparison to other cows of the breed born in the same base year.

Fat % - Predicted transmitting ability of percent of fat within milk in comparison to other cows of the breed born in the same base year.

Protein - Predicted transmitting ability of pounds of protein in comparison to other cows of the breed born in the same base year.

Protein % - Predicted transmitting ability of percent of protein within milk in comparison to other cows of the breed born in the same base year.

Lactose - The breeding value measuring kilograms of lactose in comparison to the breed average with higher values indicating more lactose content.

Lactose % - The breeding value of percent of lactose within milk in comparison to the breed average. Expressed in kilograms with a higher percentage resulting in a higher expected lactose content.

Somatic Cell Score - Somatic Cell Score (SCS) indicates genetic susceptibility for udder health, as revealed through somatic cell count. Animals with PTA SCS of less than 3.0 are expected to transmit favorable udder health, while animals with PTA SCS greater than 3.0 are expected to have daughters with cell counts higher than breed average.

CFP - Predicted transmitting ability of combined pounds of fat and protein.

MUN - A measure of crude protein digestion efficiency and nitrate excretion. By reducing MUN in milk, animal health and efficiency increases. A breeding value below 0.0 indicates a lower than average urea content in milk.

Feed Saved - Feed Saved indicates the expected reduction of feed consumed each lactation based on evaluations for Residual Feed Intake and Body Weight Composite. The trait is measured in pounds of dry matter intake.

Residual Feed Intake - Residual Feed Intake (RFI) is a measure of feed efficiency and is defined as the difference between an animal's actual feed intake and its expected feed intake based on its size and growth compared to the breed average base. RFI is independent of the level of production. The lower the RFI value, the more efficient the animal is.

HEALTH

Productive Life - Productive Life (PL) predicts the time that female offspring are expected to remain in the milking herd before removal by culling or death, expressed as difference in months of productivity compared to the breed base.

Cow Livability - Cow Livability predicts the difference in female offspring expected to remain alive while in the milking herd expressed in percentage points from the breed base.

Heifer Livability - Heifer Livability predicts the difference in female young offspring expected to remain alive between 2 days after birth and 18 months of age expressed in percentage points from the breed base.

Calf Survival - A measure of survival from day 3-365 of life. A higher breeding value indicates a higher chance of surviving their first year of life.

Milk Fever - Expected resistance of an animal's offspring to hypocalcemia (milk fever) compared to the breed average base expressed in percentage points.

Displaced Abomasum - DAB is the expected resistance of an animal's offspring to displaced abomasum (DA) compared to the breed average base expressed in percentage points.

Ketosis - The expected resistance of an animal's offspring to ketosis compared to the breed average base expressed in percentage points.

Metritis - The expected resistance of an animal's offspring to metritis compared to the breed average base expressed in percentage points.

US Mastitis - The expected resistance of an animal's offspring to clinical mastitis compared to the breed average base expressed in percentage points.

Mastitis - Sourced from CDN official evaluations. Combines both clinical and sub-clinical mastitis in a single index. Expressed as a relative breeding value where 100 is average and higher is better.

Metabolic Disease Resistance - Sourced from CDN official evaluations. Metabolic Disease Resistance (MDR) combines evaluations for six traits, including Subclinical Ketosis, Clinical Ketosis and Displaced Abomasum. Expressed as a relative breeding value where 100 is average and a higher score is desired.

Retained Placenta - The expected resistance of an animal's offspring to retained placenta compared to the breed average base expressed in percentage points.

Temperament - Sourced from CDN official evaluations. Can be defined as milking behavior. Expressed in terms of expected percentage of future daughters evaluated as average, calm or very calm during first lactation. Expressed as a relative breeding value where 100 is average.

Persistency - Sourced from CDN official evaluations. Lactation persistency reflects the animal's ability to maintain milk production at a high level after peak of lactation. Expressed as a relative breeding value where 100 is average and a higher score is desired.

Jersey Trait Explanations

Milking Speed - Sourced from CDN official evaluations. Percentage of first lactation daughters evaluated as milking average or fast. Expressed as a relative breeding value where 100 is average and a higher score is desired.

Resilience - The ability to be minimally affected by disturbances and/or recover quickly when affected by health disturbances. Resilience combines recovery (time to recovery) and stability (number of disturbances). A breeding value of 100 indicates 10.9 days of recovery time and 3.8 disturbances.

CALVING TRAITS & FERTILITY

Daughter Pregnancy Rate - Daughter Pregnancy Rate (DPR) is a female fertility trait that predicts the percentage of non-pregnant cows that will become pregnant during each 21-day period compared to the breed base.

CCR - Cow Conception Rate (CCR) is a female fertility trait predicting the lactating cow's ability to conceive, defined as the expected percentage to become pregnant at each insemination in comparison to the breed base.

HCR - Heifer Conception Rate (HCR) is a female fertility trait predicting the maiden heifer's ability to conceive, defined as expected percentage to become pregnant at each insemination in comparison to the breed base.

Fertility Index - The Fertility Index combines several reproductive components into one overall index including ability to conceive as a maiden heifer, ability to conceive as a lactating cow, and a cow's overall ability to start cycling again, show heat, conceive, and maintain a pregnancy.

Early First Calving (EFC) - Defined in days, EFC is the age at first calving. If a bull transmits the genetics expected to reduce first calving by 2 days, his PTA for EFC would be +2.0 days. Heritability for EFC is 2.3%.

Gestation Length - Gestation Length (GL) is the expected influence the animal will have on the days that their female offspring carry their calves compared to the breed average base.

Calving Ability - Sourced from CDN official evaluations. Expressed as a relative breeding value where 100 is average. A higher score indicates a tendency of calves to be born with less difficulty.

Daughter Calving Ability - Sourced from CDN official evaluations. Expressed as a relative breeding value where 100 is average. A higher score indicates a tendency of daughters to calf with less difficulty.

INDEXES

Net Merit - Net Merit (NM\$) indicates the additional net profit a daughter is expected to provide over her lifetime as compared to the breed base. Over 40 economically important traits are involved in the calculation of NM\$.

JPI™ - Jersey Performance Index (JPI™) is calculated by US Jersey as a reference for breeders. This index includes 7 traits within the 3 major categories of production, health & fertility, and conformation, in addition to a Functional Trait Index.

Cheese Merit - Cheese Merit (CM\$) utilizes the same traits as NM\$, but places a negative weight on PTA Milk and more emphasis on

pounds of protein and SCS. This index is designed for herds focused on milk production for cheese.

Fluid Merit - Fluid Merit (FM\$) utilizes the same traits as NM\$ but places more weight on PTA Milk and no weight on protein. This index is designed for herds in fluid milk markets.

Grazing Merit - Grazing Merit (GM\$) was created for pasture-based herds using intensive grazing. As compared to the other M\$ indexes, fertility receives 2.5 times more emphasis, as well as increased emphasis on production yield, longevity, livability and udder health.

CONFORMATION

JUI™ - Jersey Udder Index™ is an index reflecting the sum of PTAs for udder traits. JUI is also the number of points udder traits add or subtract from the Jersey Performance Index™. This index is calculated by US Jersey.

BCS - Sourced from CDN official evaluations. Reflects an animal's energy balance status. Expressed as relative breeding value with 100 being average. Bulls rated over 100 are more desired.

ADDITIONAL INFORMATION

GFI - Genomic Future Inbreeding (GFI) is an estimation of future progeny genomic inbreeding assuming an animal is randomly mated to genomically tested animals within its breed.

BBR - Breed Base Representation (BBR) is a genomic trait that assesses the degree to which alleles in an individual animal's genome are in common with the allele frequency of the breed reference group for Ayrshire, Brown Swiss, Guernsey, Holstein and Jersey. The more an animal's genetic make-up resembles its breed reference group, the higher its BBR for the primary breed.

Beta Casein - Genotype for beta casein determines whether an animal produces A2A2, A1A2, or A1A1 milk. A2A2 beta casein milk is desired because of the possible association with greater digestibility for individuals who are intolerant to dairy products.

Kappa Casein - Kappa Casein is a key protein in cheese making. The BB genotype is favorable in cheese making ability.

Lactoglobulin - The major protein found in whey and found to be a major allergen in cows' milk. Variant A and Variant B have been identified. The A variant is associated with increased milk yield and whey protein content and higher relative concentration of beta-lactoglobulin compared to the B variant. The B variant is associated with increased casein and fat content and is favorable for cheese production. Animals testing A/A will produce higher amounts while animals testing B/B will produce lower amounts.

PROVEN - Bulls with at least 10 milking daughters contributing to the genetic evaluation.

POLLED - Bulls who carry the polled gene, either homozygous or heterozygous.

NEW - Bulls added to the CRV lineup with the current genetic evaluation cycle.

CREATE - CRV early release sires available with a signed Genetic Partnership agreement. To use the best and brightest sires today, contact your local representative for details and a copy of the contract.

To increase transparency of information sourcing, items on this page highlighted in **gray** are sourced from the Dutch base. Those highlighted in **blue** are sourced from the US base including CDCB health and production and AJCA type.

Items highlighted in **gold** are sourced from the Canadian base.
