## DELIVERING SOLUTIONS THROUGH GENETICS

FOR AN EASY-TO-  
MANAGE HERD

CRV is not just another bull stud. What sets us apart are our core values—values that focus on delivering the genetic solutions producers need to **build better cows for a better life**. But, what does that mean for cattlemen? It means that at CRV, regardless of size, location, and management—we help producers improve their operation each year and take them to the **next level of success**.

We provide breeding and management solutions for better decision making that ultimately **lightens the workload** for ranchers. We bring innovations to farms—helping them **operate more smoothly** and get the **best results possible**.

It's simple—we help our customers build more profitable and easy-to-manage herds—it's in our genes and it's what sets us apart from the industry.

With a healthier **more consistent herd, easier-to-manage**, and profitable operation, a beef producer, herd manager, or ranch hand will achieve a better work-life balance—and here's how CRV is going to get you there.

# CONNELY **FORTUNE** 752L

<b>BREED:</b>	Angus		
<p>Fortune is a Treasure son who has seen a lot of use. This bull has done a fantastic job for a lot of top purebred herds in the U.S. His EPD profile put him in an elite category. His sons have sold really well in bull sales across the country; his daughters maybe even better. His dam is Pathfinder.</p>		<ul style="list-style-type: none"> <li>• EPD profile</li> <li>• Performance</li> <li>• Phenotype</li> </ul>

# BEEF TRAIT EXPLANATIONS

**Expected Progeny Difference (EPD)** - the prediction of how future progeny of each animal are expected to perform relative to the progeny of other animals listed in the database. EPDs are expressed in units of measure for the trait, plus or minus.

**Accuracy (ACC)** - the reliability that can be placed on the EPD. An accuracy of close to 1.0 indicates higher reliability. Accuracy is impacted by the number of progeny and ancestral records included in the analysis.

## PRODUCTION EPDs

**Calving Ease Direct (CED)** - is expressed as a difference in percentage of unassisted births, with a higher value indicating greater calving ease in first-calf heifers. It predicts the average difference in ease with which a sire's calves will be born when he is bred to first-calf heifers.

**Birth Weight EPD (BW)** - expressed in pounds, is a predictor of a sire's ability to transmit birth weight to his progeny compared to that of other sires.

**Weaning Weight EPD (WW)** - expressed in pounds, is a predictor of a sire's ability to transmit weaning growth to his progeny compared to that of other sires.

**Yearling Weight EPD (YW)** - expressed in pounds, is a predictor of a sire's ability to transmit yearling growth to his progeny compared to that of other sires.

**Residual Average Daily Gain (RADG)** - expressed in pounds per day, is a predictor of a sire's genetic ability for post-weaning gain in future progeny compared to that of other sires, given a constant amount of feed consumed.

**Dry Matter Intake (DMI)** - expressed in pounds per day, is a predictor of difference transmitting ability for feed intake during the postweaning phase, compared to that of other sires.

**Yearling Height EPD (YH)** - is a predictor of a sire's ability to transmit yearling height, expressed in inches, compared to that of other sires.

**Scrotal Circumference (SC)** - expressed in centimeters, is a predictor of the difference in transmitting ability for scrotal size compared to that of other sires.

**Docility (Doc)** - is expressed as a difference in yearling cattle temperament, with a higher value indicating more favorable docility. It predicts the average difference of progeny from a sire in comparison with another sire's calves. In herds where temperament problems are not an issue, this expected difference would not be realized.

## MATERNAL EPDs

**Heifer Pregnancy (HP)** - is a selection tool to increase the probability or chance of a sire's daughters becoming pregnant as first-calf heifers during a normal breeding season. A higher EPD is the more favorable direction and the EPD is reported in percentage units.

**Calving Ease Maternal (CEM)** - is expressed as a difference in percentage of unassisted births with a higher value indicating greater calving ease in first-calf daughters. It predicts the average ease with which a sire's daughters will calve as first-calf heifers when compared to daughters of other sires.

**Maternal Milk (Milk)** - is a predictor of a sire's genetic merit for milk and mothering ability as expressed in his daughters compared to daughters of other sires. In other words, it is that part of a calf's weaning weight attributed to milk and mothering ability.

**Mature Weight (MW)** - expressed in pounds, is a predictor of the difference in mature weight of daughters of a sire compared to the daughters of other sires.

**Mature Height (MH)** - expressed in inches, is a predictor of the difference in mature height of a sire's daughters compared to daughters of other sires.

**Cow Energy Value (\$EN)** - expressed in dollar savings per cow per year, assesses differences in cow energy requirements as an expected dollar savings difference in daughters of sires. A larger value is more favorable when comparing two animals (more dollars saved on feed energy expenses). Components for computing the cow \$EN savings difference include lactation energy requirements and energy costs associated with differences in mature cow size.

## CARCASS EPDs

**Carcass Weight (CW)** - expressed in pounds is a predictor of the differences in hot carcass weight of a sire's progeny compared to progeny of other sires.

**Marbling (Marb)** - expressed as a fraction of the difference in USDA marbling score of a sire's progeny compared to progeny of other sires.

**Ribeye Area (RE)** - expressed in square inches, is a predictor of the difference in ribeye area of a sire's progeny compared to progeny of other sires.

**Fat Thickness (Fat)** - expressed in inches, is a predictor of the differences in external fat thickness at the 12th rib (as measured between the 12th and 13th ribs) of a sire's progeny compared to progeny of other sires.
