CRV – New Zealand

2025

Delivering Better Cows > Better Life

We asked CRV customers how they worked with CRV to achieve their goals.

Genetics are helping Mark and Teresa Carter breed healthy and efficient cows that are not only helping them achieve their production targets, but their environmental and lifestyle goals too.

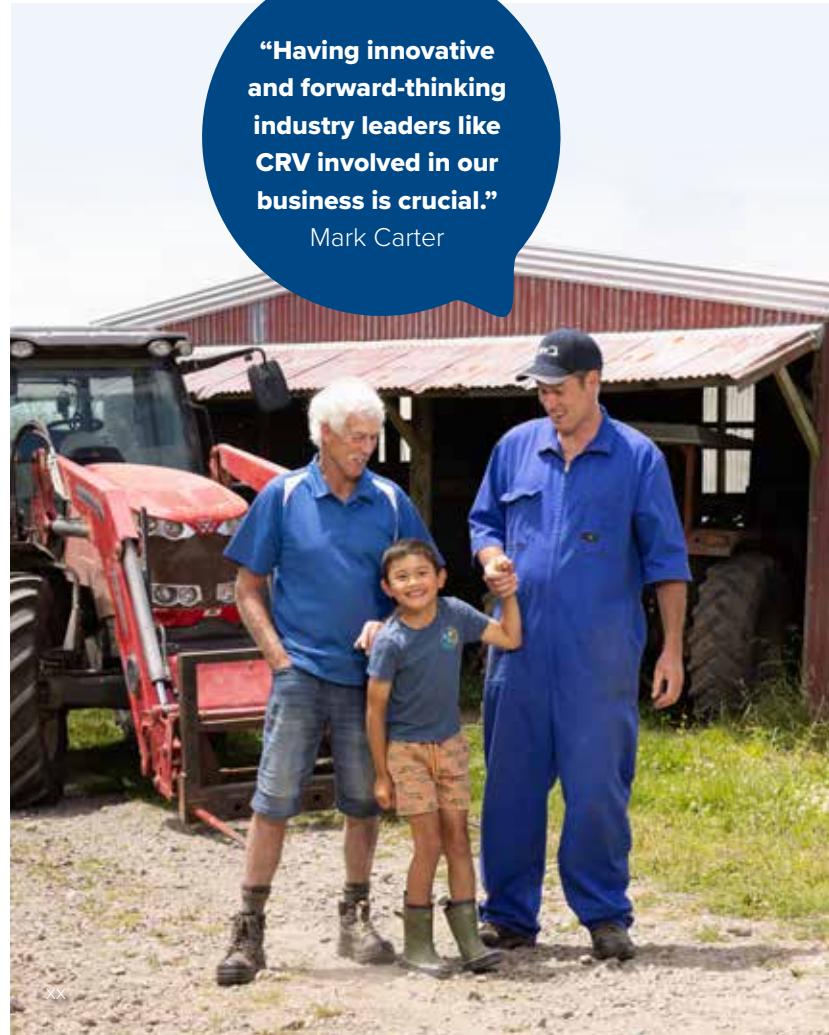

The Taranaki couple has been farming for about 13 years. They left their jobs in Auckland to return to the family farm in 2010. They part own the 108-hectare farm with Mark's parents, Greg and Denise. The family leases a further 70 hectares and runs two herds, about 450 cows in total.

The Carter's are working with CRV to breed animals that produce the same amount of milk using less feed, but also stay in their herd for longer, so they can lower their overall environmental footprint.

"With everything moving and evolving rapidly in our industry, it's more important than ever for dairy farmers to lean on their partners for expert advice and guidance," says Mark. "Having innovative and forward-thinking industry leaders like CRV involved in our business is crucial."

Mark understands that a healthy, trouble-free herd that efficiently converts feed into milk, guarantees high lifetime production.

"Our production needs to be more efficient, but we also need to be more environmentally friendly. Genetics can help us achieve both those goals by shaping what the cow of tomorrow is going to look like, so they've got a big part to play.

"If we think about the outcomes we're trying to achieve on our farm, we're trying to breed an animal that produces milk well, but also has a great temperament and is a pleasure to milk in the shed.

"If a cow can turn grass into more milk every day, that can make big a difference to the number of cows we need in our herd.

Better cows, better life certainly rings true for Mark and Teresa.

Farm details

Mark and Teresa Carter, Taranaki

450 cows

Over the last 13 years, Southland dairy farmers Caleb and Paula Hamill have worked hard to realise their dream of farm ownership. Setting firm goals to help fast track the genetic gain of their herd has been one of the keys to their success.

The Hamills started their journey with CRV in 2018 as a Progeny Test farm. They then went on to use a nominated bull team and in recent years have explored the benefits of sexed semen.

Their farm boasts impressive production figures with cows yielding over 2.5 milk solids per cow at peak and holding well through the season. Last season, Caleb and Paula achieved production of 545 kgMS per cow, despite a drop in reproductive performance.

"We grew a lot of feed down here last season, but I expect there wasn't enough guts in it, and we just did too much milk. The cows might have been full but potentially they couldn't eat enough to get the nutrition they needed."

Clear breeding goals help Southland farmers realise their dream.

"We had a good open discussion about where we wanted to go and hatched a plan."

Caleb Hamill

This setback prompted Caleb and Paula to sit down with their CRV sales consultant Tony Watt as part of a broader review of their farm operation. They worked together to look at the farm's goals and discuss how they could fine tune their breeding strategy to achieve them.

"Tony used to be our AI technician, so we know him well and we trust him. As an ex-dairy farmer, he knows his stuff, so we had a good open discussion about where we wanted to go and hatched a plan."

Now, with a clear vision for the future, Caleb is focussed on breeding traits into his herd such as capacity, fertility, udder attachment and rump width.

Farm details

**Caleb and Paula Hamill,
Winton, Southland**

465 cows

Guide to sire information

Shed traits

In all cases positive is better.

Shed temperament

The temperament of the animal in the shed after it has settled into the milking routine.

Grumpy – Lovely

Adaptability to milking

How quickly the animal adapts to the milking routine.

Slowly – Quickly

Milking speed

The length of time it takes for an animal to milk out.

Slow – Fast

Overall opinion

A farmer's overall feeling about the animal.

Poor – Well-liked

Conformation

Rump angle

The angle between the middle of the hip and top of the pin bone. A flat to slightly sloping rump is desired.

High – Sloping

Rump width

The distance between the posterior point of the pin bones in relation to the size of the cow. Good indicator of the width of a cow throughout her body.

Narrow – Wide

Legs

The angulation of the rear legs.

Straight – Curved

UDDER

Udder support

Strength of the suspensory ligament as viewed from the rear.

Weak – Strong

Front udder

The strength of attachment of the front of the udder to the body wall.

Loose – Strong

Capacity

Strength and depth of chest and body as viewed from the side.

Frail – Capacious

Rear udder

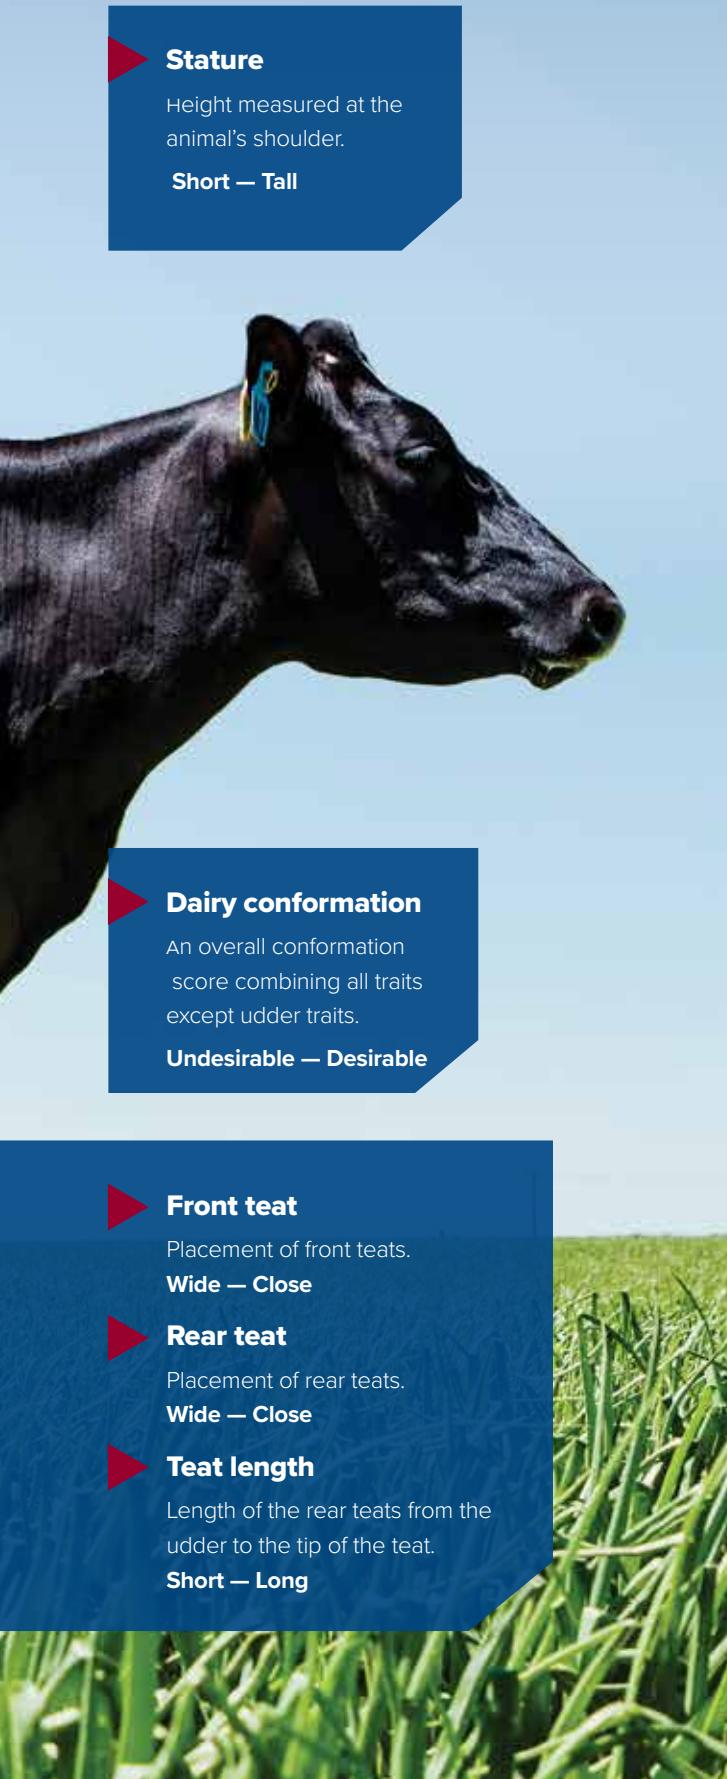

The height and width of the rear udder attachment.

Loose – Strong

Udder overall

An overall udder score combining all the udder conformation traits.

Undesirable – Desirable

► Stature

Height measured at the animal's shoulder.

Short — Tall

► Dairy conformation

An overall conformation score combining all traits except udder traits.

Undesirable — Desirable

► Front teat

Placement of front teats.

Wide — Close

► Rear teat

Placement of rear teats.

Wide — Close

► Teat length

Length of the rear teats from the udder to the tip of the teat.

Short — Long

Health

Select animals that will have fewer incidences of health problems throughout their lifetime.

Traits include: fertility, body condition score, somatic cell score, calving difficulty, udder overall and functional survival (expressed as the likely percentage of cows surviving to the next lactation).

Efficiency

Select the most efficient animals at converting feed into milk.

Key to bull pages

Look for these icons on the bull pages.

Sexed

Sires are available as sexed semen and conventional.

New

Sires are either new to the market or have been graduated from an InSire to a proven sire.

Genetic traits

FE facial eczema tolerant.

LowN lower than average for milk urea nitrogen (MUN).

SG short gestation.

OAD suited to once-a-day milking systems.

Global bulls

Semen imported from CRV Netherlands.

CRV making complex breeding decisions simple for Canterbury farmer

A complex Canterbury dairy farming operation has developed a simple breeding ethos with the help of CRV to drive productivity and sustainability.

Their advice to other farmers: Use sexed semen on your best cows to breed the herd you want faster and use beef semen on the balance of your herd to produce a high-value dairy-beef calf.

Arjan Van't Klooster, his wife Kelsi, and two boys Kees (4) and Finn (1) farm 3,500 cows across three dairy farms near

Glenavy in Canterbury, supplying Fonterra. They share milk 1,450 cows on one 360-ha farm, own a herd of 950 cows milked on a 270-ha platform, and have share milkers milking the third herd of 1350 cows on another 360-ha property.

They average 450 to 550kgMS per cow across the farms. Arjan says the lower production farm of 450kgMS is a system three, while the higher producing farms averaging between 500kgMS and 550kgMS are between a system four and five.

Using CRV genetics Arjan says their goal is to breed a cow around 500 to 550kgs that can do 100 percent of her body weight in production. Given their systems' high feed inputs, efficiency is key in everything they do.

"We found our genetics were starting to make our herds a bit too big. We had an average live weight of 670kgs for a while which is much less efficient. We also found the bigger Friesians were breaking down, so we have started to pull that size back to meet our goal," says Arjan.

For the first three weeks of mating, they artificially inseminate about 60 percent of the total herd with sexed semen, choosing their best-producing cows and heifers that meet their type requirements for breeding replacements. They then use dairy beef semen,

transitioning to Wagyu, and finally a short gestation beef on the balance of the herd. The total mating period takes about nine weeks.

"Using dairy beef and the Wagyu bulls gives us a high-value dairy-beef calf and reduces our number of bobby calves so there is less waste and better animal welfare," says Arjan.

"We focus on the efficiency and fertility of our herd to minimise waste on our system and that's a big driver for using sexed semen. We can drive that genetic gain in our herds by using specific bulls for our top genetic cows and heifers so we can be assured of no bobbies."

He says they have been maintaining and improving production each year, even as they have seen their cow size reduce to around 550kgs.

"We've done a few things on the farms as we have looked to drive efficiency. But in terms of maintaining and growing our production, I would put that purely down to the genetics we're getting from CRV."

Arjan says they have no real concerns about their in-calf rate using sexed semen. They use cow collars on all the herds, except their heifers where they use Estrotect™ breeding indicators.

"The collars and Estrotect patches have been great for clearly identifying cows and heifers in heat and ready for mating," says Arjan.

Their herds of 950 cows and 1,350 cows are also part of CRV's progeny testing programme, which Arjan says has been instrumental in identifying high-quality bulls for those herds. It also means their entire herds are DNA tested so they can be sure of the genetics they have.

Arjan says being part of CRV's progeny testing programme means the stress of choosing bulls is removed and they get a good selection of high-quality bulls. However, he does nominate sires for his heifers.

"I nominate the bulls that go over the heifers because I don't want a heavy calving bull," says Arjan. "For the heifers it's 100 per cent nominated sexed semen straws because those heifers are going to give me my quickest genetic gain."

"Overall, our experience with CRV has been excellent. CRV is playing a crucial role in driving genetic improvement across our herds and ultimately contributing to our farms' success."

SireMatch

Get the most out of your herd with breeding support tool, SireMatch.

SireMatch is a report, tailored to your herd and farming situation by CRV's experienced sales consultants. It helps to prevent inbreeding and genetic defects using your cow's pedigree information. It can also indicate the three best bulls to use per cow, based on your preferences.

SireMatch analyses the breed make-up of your herd and can sort the breed information of your cows into separate groups. As a result, you can mate specific bulls to specific breeds of cows in your herd, for example:

- ▶ Your group of Friesian cows to Jersey bulls
- ▶ Your group of Jersey cows to Friesian bulls
- ▶ Your group of Crossbred cows to both Jersey, Friesian and Crossbred bulls

Understanding New Zealand Graphs

BREEDING VALUES

New Zealand Animal Evaluation Limited (NZAEL) calculates **Breeding Values (BV)** and **Breeding Worth (BW)** index using information from the sire's relatives (ancestry and progeny) and the sire's own records by comparing it to that of the **Genetic Base Cow**.

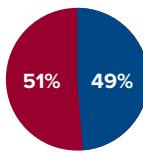

The genetic base cow is the average of a group of well-recorded New Zealand cows (across all breeds) and is updated every five years to reflect genetic progress. BW and BVs are now expressed relative to this genetic base.

BVs are deviations above or below (-) the same genetic base cow (regardless of breed). BA is Breed Average.

NZMI is a CRV index, which breeds towards strong and capacious cows that are efficient producers of high-value milk, with good shed traits, fertility and the udders to keep them profitable and producing in the herd for longer.

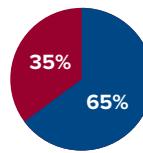

BREEDING VALUES

New Zealand Merit Index - **NZMI**

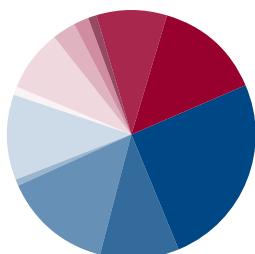

- ▶ A desired gains index with focus on the future.
- ▶ Health traits will become more relevant and therefore have a higher weighting with NZMI.
- ▶ NZMI includes many of the same traits as BW and with the inclusion of key functional traits (Overall Opinion, Capacity, Rump Angle and Calving Difficulty) can be considered BW Plus.
- ▶ NZMI aligns with CRV's global position as a Leader in Health and Efficiency.

Breeding Worth - **BW**

- ▶ Economic index used to rank ability to convert feed into profit.
- ▶ BW has a strong weighting on Efficiency.
- ▶ Traits included in BW are: Protein, Fat, Milk Volume, Liveweight, Fertility, Somatic Cells, Body Condition, Functional Survival and Udder Overall.

New Zealand Merit Index - **NZMI**

FatBV	14%	CalvingDifficultyBV	1%
ProteinBV	25%	SomaticCellBV	8%
MilkBV	10%	OverallOpinionBV	3%
LiveweightBV	14%	CapacityBV	2%
FunctionalSurvivalBV	1%	RumpAngleBV	1%
FertilityBV	11%	UdderOverallBV	9%

BREEDING INDICATORS

NZMI

LOW

HIGH

This is the CRV desired gains index. It aims to breed a productive, long-lasting cow that will typically produce about 450 kgMS a year by balancing production, management and type traits.

BW

LOW

HIGH

Economic index that ranks bulls and cows on their expected ability to breed profitable and efficient replacements.

TOTAL LONGEVITY

LOW

HIGH

The total longevity breeding value is defined as the expected genetic merit of a cow to live for more (or fewer) days of herd life relative to the genetic base cows.

LIVEWEIGHT

LOW

500 kgs

HIGH

Expressed as 5-year-old mature liveweight in kilograms.

Breeding values for liveweight are estimated using information that comes from 'traits other than production' (TOP) weight scores of 2-year-old heifers, and from scale weight records of cows measured during one or more of their first 6 lactations.

CRV HEALTH %

LOW

HIGH

The CRV index known as CRV Health helps you select animals that will have fewer incidences of health problems throughout their lifetime.

CRV EFFICIENCY %

LOW

HIGH

The CRV index known as CRV Efficiency helps you easily see the expected efficiency value of an individual sire.

PRODUCTION

MILK (LTS)

LOW

4595 ltr

HIGH

This trait measures the expected volume of milk produced by the individual and is of interest due to transport costs associated with moving milk from farms to processing plants around the country. This is why milk is valued negatively in both NZMI and BW.

PROTEIN (KG)

LOW

218 kg

HIGH

Milk protein is a component of the milk produced by cows and is the most valued output (by processors) from NZ dairy farms. It is also the single most important trait for both NZMI and BW.

FAT

LOW

218 kg

HIGH

Milk fat is the other component of milk which is paid for by milk processors in NZ and is used in producing lower value commodities such as butter.

MANAGEMENT & HEALTH

FERTILITY

Expressed as the percentage of cows pregnant in the 1st 42 days from planned start of mating. A higher fertility breeding value indicates that a bull is expected to have more early pregnant daughters than a bull that has a lower breeding value for fertility.

BODY CONDITION SCORE (BCS)

Body condition score is commonly used as a method to assess body energy reserves.

SOMATIC CELLS SCORE (SCS)

Good udder health is typically reflected in low levels of somatic cell counts in milk.

CALVING DIFFICULTY (HFR CD, COW CD)

Calving difficulty breeding values are estimated from calving assistance information collected in progeny test herds only or cows that have been TOP inspected as heifers. Sires with negative calving difficulty breeding values will produce progeny that cause less calving difficulties than average.

GESTATION LENGTH

The number of days shorter or longer than the average gestation period of a dairy cow. Use this strategically to tighten your calving pattern.

FUNCTIONAL SURVIVAL

Expressed as the likely percentage of cows surviving to the next lactation independent of culling for low production or poor fertility.

SHED TRAITS

ADAPTABILITY TO MILKING

A description of how soon the animal settled into the milking routine after calving specifically taking into account how many milkings before let down was spontaneous and completed without extra attention.

SHED TEMPERAMENT

Measures the temperament of the animal in the shed while being handled and milked. It is a different trait to adaptability to milking as it is assessed once an animal has settled into the milking routine.

MILKING SPEED

The length of time from putting on the cups to when the milk flow stops or cups are taken off. Those cows that have nice silky udders (in contrast to meaty, lumpy udders) tend to be quicker milkers.

OVERALL OPINION

A farmer's overall acceptance of the animal as a herd member.

CONFORMATION

STATURE

The height at the shoulder of the animal. This trait is measured across all breeds, resulting in all Jerseys being negative on the breeding values bar graph, Ayrshires being intermediate and Friesians being mainly positive.

CAPACITY

Combination of strength and depth of chest and body as viewed from side, rear and front in relation to the physical size of the cow. This is an important trait and reflects an animal's ability to convert feed into milk and withstand the rigours of life.

RUMP ANGLE

Describes the angle between the centre of the hip and the top of the pin bone. A low score indicates the cow has high pins and a high score indicates low pins. A score of 5-6 describes a flat rump to slightly sloping which is optimal.

FRONT UDDER

Measures the strength of attachment of the fore udder to the body wall.

REAR UDDER

Describes the height and width of the rear udder attachment as distinct from udder support.

FRONT TEAT

The placement of the front teats (at the point of attachment to the udder) relative to the centre of the quarters. A low score indicates wide front teats whilst a high score indicates close front teats.

RUMP WIDTH

Distance between the most posterior point of the pin bones relative to the size of the animal. This trait is a good predictor of the width a cow has throughout her body.

LEGS

Measures the angulation or 'set' of the rear legs and is measured from an imaginary line between thurils and mid-hoof while the cow is walking. A low score indicates a straight leg, whilst a high score indicates a sickled or curved leg set. A score close to 5-6 is considered ideal.

UDDER SUPPORT

This trait describes the strength of the suspensory ligament as viewed from the rear. It also includes the udder depth relative to the hocks. Udder support is a very important trait in determining the number of lactations a cow's udder will survive.

REAR TEAT

The placement of the rear teats (at the point of attachment to the udder) relative to the centre of the quarters. A low score indicates wide rear teats whilst a high score is close and 5 is central.

TEAT LENGTH

Length of the rear teats from the udder to the tip of the teat. A score between 4 and 5 is optimum.

UDDER OVERALL

The inspector gives an overall score of the udder including any other udder traits not measured before. Udder overall score can be used to simply compare the overall udder standard of bull daughters.

DAIRY CONFORMATION

An overall conformation score combining all traits except udder traits. Dairy conformation is a useful trait for simply comparing animals for dairy type.
